

Plivo Campus Hiring Assignment – Product Ops Engineer

Dear Candidate,

As part of the hiring process, you are required to complete a **Google Sheets assignment**. This exercise will test your ability to work with raw data, transform it into structured outputs, and generate insights that support decision-making. You may use LLMs to help you understand the assignment, learn relevant syntax, or structure your analysis, but the work must be completed in **Google Sheets only**. The assignment is designed to be completed within **120 minutes**.

Business Problem

You have been provided with student application data from a campus recruitment drive. The dataset is messy, inconsistent, and spread across four tabs:

- **Applicants_Raw** – student details, test scores, attendance, internship preferences
- **Dept_Lookup** – mapping of department name variants to standardized names
- **Interview_Slots** – available internship slots and minimum eligibility criteria for each company
- **Scoring_Weights** – weights assigned to each test for calculating the final score

Your task is to:

1. Clean & Standardize the Data

- Correct inconsistent text, dates, and formats.
- Normalize department names using the lookup table.
- Remove any duplicate data (unique Student IDs with the latest application date to be retained)

2. Calculate Key Metrics

- Compute weighted scores based on the scoring weights provided.

- Identify student eligibility based on attendance and performance.
- Generate ratios, averages, and other summary metrics across departments.

3. Allocate Internship Slots

- Match eligible students to internship slots as per company rules.
- Handle oversubscription (when more students are eligible than slots) and shortfalls (when slots go unfilled).
- Present allocation outcomes clearly.

4. Summarize Insights

- Use pivots, charts, and formatting to highlight trends (e.g., best-performing department, company preference distribution).
- Provide a concise written summary (2–4 bullet points) in the sheet itself.

What is Expected of You

- A cleaned and structured dataset ready for analysis.
- Correctly computed weighted scores and eligibility status.
- Logical and transparent allocation of students to company slots.
- Use of formulas, lookups, pivots, and charts within Google Sheets (not manual work).
- A concise summary of key insights directly in the sheet.
